# Industrial Films

*Hyplast NV has a long tradition in producing films for industrial applications. In particular, Hyplast has developed excellence in producing extra wide multilayer (7 layers) films, some of them with barrier properties (based on Polyamide and/or EVOH). Many of these products are custom-made, but for the Automotive and Liner segments Hyplast has a limited standard product range.*

## Automotive

Lacquers and coatings are essential for the protection and esthetics of all kinds of vehicles. Upon assembly, as well as in the after market, the application of new lacquers is a precise and important process. Under the trade name 'Hytiprotect', Hyplast offers a range of high-quality masking films. Next to the standard range, Hyplast offers a product line for large vehicles, as jeeps and small trucks, and a special range for high temperature applications like infrared drying.

## Liner film

Intermediate quantities of dry bulk materials or liquids, like chemicals, prime or semi-processed raw materials and solvents can be transported economically in modular standard transport units like FIBC's, cubitainers or sea containers. Liners are used to protect the merchandise against pollution by the container, and against harmful influences from outside (like humidity or oxygen). Hyplast acquired several years of expertise in the formulation of pure polyethylene and multi-layer barrier films for such liners. Thanks to its specific machinery, both tubular and flat film can be supplied in sufficiently large sizes to ensure an economic production.

## Packaging

For many years, polyethylene film is a firm value in the protection and packaging of consumer goods and transport units. Based upon a wide application knowledge and major formulation capabilities for sealing layers and functional demands, Hyplast offers mostly custom-made solutions.
